

## Abstract

A braking- and damping device, in particular for movable pieces of furniture, having a fluid-cylinder (1) in which two pistons (2, 5) are arranged in linearly displaceable manner. A piston (2) is displaceable over a piston rod (3). Arranged between the two pistons (2, 5) is an elastically deformable sealing member, which, when damping occurs, is deformed by being squeezed between the two pistons (2, 5) and pressed against the cylinder wall (7).
